

# Aquiring a Perfect Sight Picture

## Instructions:

1. Hang target so that the eye level marker is at the shooter's eye level. 10 feet is a good distance for this exercise.
2. Perfect sight picture = crystal clear front sight tip perfectly centered within an out-of-focus rear sight and held at the proper aiming point of an out-of-focus target.
  - On a modern semi-auto pistol, this usually means that the tip of the front sight will "split" the center of the target at distances of 10-25 feet.
3. Once you have acquired the perfect sight picture, hold it steady and slowly apply increasing pressure to the trigger until it breaks.
4. The bullet will go exactly where the tip of the front sight is pointing, at the immediate instant that the trigger breaks. If the sight picture is not correct right before the trigger breaks, start over. Don't rush it.
5. The front sight should be in clear focus before, during, and after the shot. Try hard not to focus on the target.
